Bacillus anthracis causes anthrax in all mammals including humans depending upon the route of entry of *B. anthracis* spores infection can result in cutaneous lesions which are readily treatable with antibiotics or systemic lethal disease which is nearly always fatal the continuing worldwide incidence of anthrax in animal populations the risk of human infection associated with animal outbreaks and the threat of use of *B. anthracis* as a biological weapon warrant continued investigation of this organisms and its virulence mechanisms furthermore *B. anthracis* is an excellent model system for investigation of virulence gene expression by bacteria

when it comes to bacterial disease we are living in a state of false security antibiotics have indeed brought unprecedented health benefits protection from and cure of bacterial diseases during the past 50 years but there are ominous signs that the fortress and the defenses built on antibiotics are crumbling they are crumbling because we wittingly or unwittingly created selective conditions for the emergence of superior pathogens that can no longer be controlled by antibiotics there are numerous warnings after a long period of eclipse tuberculosis has now emerged as a serious threat unchecked by antibiotic treatment recent years have seen reports of cholera epidemics of anthrax infections of serious problems with salmonella and even with *E. coli* just to name a few mankind is in a race with microbial invaders the challenge is to anticipate and respond to developments that affect the precarious balance between man and microbe this will require new

knowledge and it will take time for an effective application of that knowledge

the comprehensive sourcebook of bacterial protein toxins fourth edition contains chapters written by internationally known and well respected specialists this book contains chapters devoted to individual toxins as well as chapters that consider the different applications of these toxins considerable progress has been made in understanding the structure function interaction and trafficking into cells as well as mechanism of action of toxins bacterial toxins are involved in the pathogenesis of many bacteria some of which are responsible for severe diseases in human and animals but can also be used as tools in cell biology to dissect cellular processes or used as therapeutic agents novel recombinant toxins are already proposed in the treatment of some diseases as well as new vaccines alternatively certain toxins are also considered as biological weapons or bioterrorism threats given the multifaceted aspects of toxin research and the multidisciplinary approaches adopted toxins are of great interest in many scientific areas from microbiology virology cell biology to biochemistry and protein structure this new edition is written with a multidisciplinary audience in mind and contains 5 new chapters that reflect the latest research in this area other chapters have been combined deleted and fully revised as necessary to deliver relevant and valuable content descriptions of relevant toxins as well as representative toxins of the main bacterial toxin families to allow for a better comparison between them focused chapters on toxin applications and common properties or general features of toxins
